

Describe a concept for handling the different error types:

Error type	Possible cause	How would you handle this?
Driver	Communication error.- link break between the driver and the peripherals. Data corruption	Checksum or parity check
Signal Status	non creation of event on data signal signal aging - non updating of new signal value wrong configuration of signal flow	recheck design and configurations in RTE
Signal Age	Explicit resetting of signal age missing Non updating of new signal value, which would result in signal aging	reset the age of corresponding signals as soon as they are serviced
